Diamonds
For diamond impregnated bits **Dieckmann** only uses the highest quality of monocrystalline synthetic diamonds.
The consistency of shape, granular size and strength make these diamonds better than natural stones.

Matrixes
Six different matrixes are available:

- SS** very soft matrix for very hard to extremely hard non abrasive formations
- S** soft matrix for hard to very hard non abrasive formations
- SH** soft to medium hard matrix for hard non abrasive formations
- MH** medium hard matrix for hard to very hard slightly abrasive formations or medium hard medium abrasive formations and for reenforced concrete
- MH/EH** medium to hard matrix for medium abrasive formations
- EH** hard matrix for abrasive formations
- EEH** very hard matrix for very abrasive formations

Impregnation heights
Three different standard impregnation heights are available and that are 4, 6 and 7.5 mm. Other impregnation heights are available on request.

Profiles
Two different profiles are available and that are flat profile for all formations and V-profile only for non cracked formations. The flat profile is standard.

Diamond concentration

As standard **Dieckmann** uses concentration 50. Other concentrations are available on request.

All possible combinations of matrixes, impregnation heights, profiles, widths of waterways, qty. of waterways and concentrations are available.

Waterways

Narrow waterways (3 mm width) are standard. Wider waterways (especially in cracked formations) are available on request.

Also non standard diameters are available on request.

Remarks:

Face discharge, scallops and TC reenforced bodies are available for all types of bits if possible.

If a type of bit is required that is not shown in the tables, **Dieckmann** will probably have all necessary data to produce the bit. If not, a drawing or a sample will be sufficient for us to do it.
